

Evidence-grounded Reading for Research Papers

A compact fixture for PaperIdea reader validation

Abstract

The method fuses multi-scale features to improve localization under severe occlusion.

Every generated claim is linked to its page, selected source text, model, and time.

This makes the interpretation reviewable instead of presenting an unsupported conclusion.

2. Method

The reader renders each page with a canvas and a selectable text layer.

Only text explicitly selected by the researcher is sent to the language model.

If the excerpt is insufficient, the assistant must state that more context is required.
